21 October

Work summary

Invitations, membership, exports and the split between instant notifications and scheduled reminders.

The request

Three gaps in the product were picked out of the audit list and delivered end to end, together with a split of the push notifications into the ones that have to arrive at once and the ones that belong on the fifteen minute schedule.

1 · an invitation link that works while signed out 2 · leaving a crib and handing it over

6 · exporting the history as a PDF plus · instant transactional push, scheduled reminders

What was built

An invitation link that survives a signed out phone

done

Opening an invitation while signed out used to fail and the link was lost. The token is now kept on the device, the app shows an "You are invited" card, and the moment the person has an account the crib joins itself. A dead invitation now explains itself instead of showing a network error.

lib/core/utils/deep_link.dart · lib/data/pending_invitation.dart · lib/app/paycal_app.dart · lib/features/shell/main_shell.dart

Leaving a crib and handing it over

done

A member can leave a crib on their own; the membership keeps its history, so the expenses of somebody who left keep validating, and the recurring payments they paid for pause instead of running without a payer. The owner hands the crib over to another member; the owner cannot leave a crib that still belongs to them, so a crib never ends up without an owner.

public.leave_crib · public.transfer_crib_ownership · lib/data/supabase_crib_repository.dart · lib/features/cribs/crib_detail_screen.dart

The history as a PDF

done

The crib sheet gained an export. The document carries the same numbers as the app, because both come from the same ledger: what was spent, what every member owes, the expenses and the settlements. It is shared through the system sheet and is built on the phone, with the fonts of the app.

lib/core/export/ledger_pdf.dart · lib/core/export/export_ledger.dart · package:pdf 3.13.1

Notifications that arrive at once, reminders that do not

done

Transactional notifications used to wait for the sweep of the scheduler. The device of the member who did something now asks for the transactional notifications to go out right away, and only those: a recurring reminder keeps the pace of the fifteen minute schedule and is never delivered early by a device.

lib/core/notifications/notification_dispatcher.dart | public.claim_push_transactional_jobs | supabase/functions/dispatch-notifications | cron · every 15 minutes

Two problems found on the phone

The channel of the reminders was created too late

done

A push that reaches a closed app is handled before any activity starts, so a channel that only the activity created did not exist yet and the reminder landed in a silent fallback channel that never showed up. The channel is now created by the application, before anything else runs.

android/app/src/main/kotlin/.../PayCalApplication.kt | android/app/src/main/AndroidManifest.xml

The device was registered without the permission to show anything

done

Notifications are on by default, but the system permission was only asked for in a settings sheet that nobody had to open. The device was registered with the backend and the system dropped every notification before it was shown. The permission is now asked the first time the device talks to the backend.

lib/core/notifications/push_notification_service.dart

How it was verified

- The database: the new functions were called against the live database with real accounts. Leaving twice, leaving as the owner and handing over to somebody who is not a member are all refused with the right message, the handover moves the ownership, and the claim of the transactional rows is closed for anybody who is not signed in.
- The function: the member path, the scheduler path and the operations path were each called with the header they use. A member claims the transactional rows only, the scheduler claims everything, and a request without a token is answered with 401.
- The phone: an expense added by another member reached the device within seconds, on the channel paycal_reminders, with the title ”PayCal update” and the body of the expense.
- The build: flutter analyze is clean and the whole suite of 292 tests passes, including ten new ones about leaving, handing over, the signed out invitation and the PDF.

What is still open

- iOS: the app needs an APNs authentication key in Firebase and a real device before a push can be verified there. The Android path is done.
- Mail: there is no custom SMTP yet, so the confirmation mail is limited to two an hour and the address is confirmed without a link. That is a stop gap, not a decision.
- The cadence of the recurring reminders is fifteen minutes. A reminder can therefore arrive up to fifteen minutes late; a shorter cadence is a change of the schedule, not of the code.
